

Executive Summary

This project analyses more than **279,000 Airbnb listings** and **5 million customer reviews** collected from ten major cities worldwide. The objective is to understand Airbnb pricing behaviour, tourism demand, customer satisfaction and investment opportunities using Python for data preparation, exploratory analysis, and machine learning, followed by interactive dashboards developed in Power BI.

The project identifies the key factors affecting listing prices, analyses tourism hotspots through customer reviews, evaluates seasonal demand, and predicts Airbnb prices using machine learning models. The final dashboard enables investors and stakeholders to compare cities and neighbourhoods to support investment decisions. This project is designed for Airbnb hosts, property investors, and business analysts who need data-driven insights into pricing strategies, market demand, and investment opportunities across major global cities.
